# **1** Introduction

The Emoji Language  $(\bigoplus)$  is a constructed language with a logographic writing system that consists solely of Unicode Emoji. It was created by Thomas Heller in 2021. The language exhibits an *agglutinative morphology* and *VSO syntax*.

More information about the Emoji Language can be found on the Emoji Language website at: https://tmh.conlang.org/emoji-language/

#### 1.1 Goals

The goal of the Emoji Language project was to prove that Unicode Emoji can be used to build a fully functioning language that can potentially be used for everyday conversation.

At the same time, I wanted to make the language actually practical to use and avoid needless complexity in the grammar, so that people could actually have fun using the language.

Also, from a technical point of view, the language is supposed to work with any recent device that supports Unicode Emoji, without installing extra software.

#### 1.2 Challenges

#### 1.2.1 Abstract emoji

Unicode Emoji already contain a lot of symbols that can be used to represent specific, tangible concepts without having to tweak their definitions.

For example, the emoji  $\overset{\bullet}{\bullet}$  and  $\overset{\bullet}{\bullet}$  can be added to the dictionary straight away as nouns symbolizing "apple" and "guitar", respectively.

However, due to their static visual nature, emoji make it difficult to express more abstract and dynamic concepts:

- Copular and modal verbs (e.g. "to be", "must")
- Verbs in general (e.g. "to give", "to take")
- Nouns for categories (e.g. "animal", "fruit")

There is a limited number of abstract emoji – such as arrows – that can be used to express abstract concepts, like tense or location. When defining the lexicon, I had to find a good balance in an attempt not to waste these rare symbols.

It quickly became apparent that identical emoji would have to be used for both noun and verbs meanings. Such homonyms prevent the reader from recognizing the lexical category of an emoji by just looking at it, but are necessary to express basic concepts with the limit set of Unicode Emoji.

#### 1.2.2 Ambiguous emoji

Since emoji have been around several years, people already developed habits regarding their use, and not everyone agrees on the meaning of certain emoji.

The Emoji Language, however, must be quite strict when defining the meaning of some emoji, to ensure that basic concepts can be expressed unambiguously.

For very common emoji like  $\stackrel{\bullet}{\leftarrow}$  and  $\stackrel{\odot}{\odot}$  I tried to stick with their familiar meaning. Nonetheless, Emoji Language is a language in its own right. Like with other foreign languages, and even though it seems partially familiar, its vocabulary must be learned explicitly.

#### 1.2.3 Rejected emoji

Several emoji proposals were already rejected  $^1$  and thus must be represented using existing emoji.

#### 1.2.4 "Twin" emoji

A few emoji exist in pairs with little or almost no discernible difference, such as:

- $\checkmark$  and  $\uparrow$  (some fonts even depict both pins with the same angle)
- $\Rightarrow$  and  $\Rightarrow$  (some fonts even depict both cars with the same color)

To avoid possible confusion for the readers, the best course of action was often to declare these emoji as synonymous, with the obvious downside of reducing the number of available emoji further.

<sup>&</sup>lt;sup>1</sup>See http://randomguy32.de/unicode/misc/rejected-emoji-proposals/

#### 1.3 Foundation

The Emoji Language is currently based on the Full Emoji List (v13.0), available from the Unicode Consortium: https://unicode.org/emoji/charts-13.0/full-emoji-list.html

That list contains a total of 3,304 emoji when taking all possible combinations of gender, skin tone and other modifiers into account.<sup>2</sup>

Some emoji<sup>3</sup> are available as both a black and white as well as a color variant. In such cases, the color variant should be used whenever possible, to keep the presentation of emoji consistent.

# 2 Phonology

As Emoji Language is primarily a *visual* language, there isn't any phonology per se, and, technically speaking, there are no phonemes or syllables.

#### 2.1 Spelling Emoji Language

Even though Emoji Language doesn't have any pronunciation by itself there is a need to communicate individual emoji symbols verbally, like when teaching Emoji Language to others or discussing Emoji Language in general in another language.

In such instances, the  $CLDR\ Short\ Name$  from the Full Emoji List mentioned above should be used to refer to individual emoji symbols.<sup>4</sup>

### 3 Writing system

Emoji Language is written using Unicode Emoji and therefore does not make use of any other familiar glyphs such as letters of the Latin alphabet or punctuation.

(For more information about spelling names from the Latin alphabet, see the Flag spelling section.)

<sup>&</sup>lt;sup>2</sup>See https://unicode.org/emoji/charts-13.0/emoji-counts.html

<sup>&</sup>lt;sup>3</sup>See https://unicode.org/emoji/charts-13.0/emoji-variants.html for a complete list.

<sup>&</sup>lt;sup>4</sup>Note that CLDR Short Names may change in the future. For more information about CLDR, see: https://unicode.org/emoji/format.html#col-name

#### 3.1 Spacing

Each word is separated by horizontal spacing.

Because there is no emoji symbol that represents a full stop, each **sentence** must start in a new line. To increase readability, it is recommended to add one extra blank line between sentences, and two between paragraphs.

Emoji Language is typically written from left to right, however, if the default text direction of the writer's input device is right to left and the reader expects it as well, this writing direction is by all means acceptable as well.

#### 3.2 Punctuation

The gesture  $\stackrel{\flat}{\leftarrow}$  is used for quotation marks, for example:

(1)  $\P \ \ \textcircled{o} \ \ \textcircled{o} \ \ \overset{\bullet}{\to} \ \overset{\bullet}{\Rightarrow} \ \overset{\bullet}{\to} \ \overset{\bullet}{\to}$ 

Aside from that, there are no distinct punctuation marks, although the symmetric subordinate clause emoji serve a similar purpose (see Subordinate clauses).

#### 3.3 Digital input

To make Emoji Language work in practice, people need some way to input emoji quickly and easily. Current smartphone keyboards usually hold a history of recently used emoji for fast access, which is a step in the right direction, and they usually offer to search for emoji by *CLDR Short Name* a well.

As a rule of thumb, people should not need to type more keystrokes to enter an emoji than they would need to enter the corresponding word in English. To optimize emoji input on desktop devices further, I have created an experimental *Emoji Input Tool* that can be found here: https://tmh.conlang.org/emoji-language/emoji-input.html

# 4 Morphology

Technically speaking, a single emoji could be considered a single morpheme.

Looking at the Unicode Emoji standard, there are several emoji that consist of multiple emoji characters internally which are concatenated by invisible "zero width joiner" (ZWJ) characters to form a

These emoji would still be considered single morphemes, because they are intended to be displayed as single emoji. If such emoji show up as separate images, it is just due to technical limitations, not by design.

Examples:

- 🖋 A single emoji (rocket) that would be considered a single morpheme.
- An emoji ZWJ sequence. Technically made up of multiple characters: "person" (<sup>(i)</sup>) and "cooking pan" (<sup>(i)</sup>). Should be displayed as a single emoji on modern devices. Either way, it would be considered a single morpheme.
- 🐑 🖝 Two separate emoji (sheep, bowl) which would be considered multiple morphemes.

Usually, Emoji Language words are made up of single morphemes. If they have prefixes and/or suffixes, or are compound words, they will consist of multiple morphemes.

Words in Emoji Language belong to one of the following word classes:

- Nouns (n.)
- Verbs (v.)
- Adjectives (adj.)
- Adverbs (adv.)
- Pronouns (pp., dem., int., rel.)
- Conjunctions (conj.)
- Interjections (interj.)
- Quantifiers (num.)

In addition, some emoji are used for the following purposes:

- Prefixes (possessive, demonstrative, locative, interrogative, negation, mood)
- Suffixes (tense, comparison, ordinality)
- Punctuation ("⊌")

All word classes are quasi-closed classes. Aside from noun compounding it is not possible to add new words to the language, because there is no straightfoward technical way for us to include new emoji that would be available to all users without installing extra software on their devices.

The only way for new root words to be added to Emoji Language is for the Unicode Consortium to publish a new version of the Emoji standard, so definitions for them can be added in the Emoji Language dictionary. It is possible to submit proposals<sup>5</sup> for new emoji directly to the Unicode Consortium though.

#### 4.1 Nouns

Nouns are inflected for number, possession, and demonstrativeness by affixation.

Also, nouns can be modified using locative prefixes and the instrumental, benefactive, and equative prefixes.

Definiteness is not explicitly marked, however, the demonstrative prefixes can be used to convey a similar meaning if it's not obvious from context.

#### 4.1.1 Number

Emoji Language distinguishes between singular and plural. By default, nouns are considered singular. Plural is indicated by reduplication:

Number	Example	Translation
singular		house
plural		houses

In compound nouns, only the last symbol is reduplicated:

Number	Example	Translation
singular	۵.	timezone
plural	کمبر کمبر 🕒	timezones

<sup>&</sup>lt;sup>5</sup>See https://unicode.org/emoji/proposals.html

#### 4.1.2 Possession

There are six possessive prefixes – singular and plural for each of the three persons:

Person	Number	Example	Translation
first	singular	👆 🐫	my camel
second	singular	👇 🐫	your camel [sg.]
third	singular	<b>- 4</b>	his/her/its camel
first	plural	🖕 👆 🐫	our camel
second	plural	👇 👇 🐫	your camel [pl.]
third	plural	<b>~~</b> *	their camel

By default, possessive prefixes are not gender-specific, however, if needed, the following gender prefixes can be used for third person possessive prefixes:

Person	Number	Gender	Example	Translation
third	singular	male	👨 👉 🐫	his camel
third	singular	female	👩 👉 🐫	her camel
third	plural	male	👨 <b> ``</b>	their [male] camel
third	plural	female	<b>0</b> *	their [female] camel

Possession can also be indicated using the verb  $\square$  (to have sth., to own sth.), as in:

(2) Ave[PRS] 1SG[NOM] camel[ACC] 'I have a camel.'

There is no genitive case in Emoji Language to express possession. Instead, compounding or relative clauses are used (see the Compound nouns and Relative clauses sections, respectively).

#### 4.1.3 Demonstrativeness

The demonstrative prefixes 2 and 2 can be used to refer to objects close to or far away from the speaker, respectively:

Distance	Example	Translation
proximal	<i> </i>	this tree
distal	<b>*</b>	that tree

For plural nouns, the prefix is reduplicated as well:

Distance	Example	Translation
proximal		these dresses
distal	<b>````````````````````````````````````</b>	those dresses

Demonstrative prefixes can also be used to convey a sense of definiteness.

#### 4.1.4 Locative prefixes

Emoji Language has a variety of locative prefixes that can be used to indicate the place or motion of an event:

Prefix	Description	Example	Translation
•	at	┦ \□ 🏠	at my house
тор	on top of		on the sofa
<b>G</b>	to, towards		to church
	from	₽71 ¶	from the airport
<b>.</b>	into, inside	2	into the river
1	out of, outside	1	out of the train
Ĵ / UP!	up		up the mountain
<b>&gt;</b>	over, across, above		across the field
<b>1</b>	down	<b>1</b>	down the sofa
	around	<b>S</b> 1	around the danger
\$	through	∎≱₽	through the forest
t)	between, among	🔁 🌢	among the flowers
BACK	behind	BACK	behind the fog
↓	below		below the clouds
1	ahead, in front of	1 👆 🖕	ahead of us
<u>0</u>	close to, near	<b>2</b>	near the sea
←	left of	<b>~</b>	to the left of the tree
$\rightarrow$	right of		to the right of the church
$\overline{\mathbf{\cdot}}$	opposite to	•• <b>क्वि</b>	opposite to the school
<u></u>	at a distance		far from home

The following examples sentences demonstrate the use of locative prefixes in context:

- (21) Q Q go[PRS] student-PL[NOM] to-store opposite-school 'The students go to the store opposite the school.'

#### 4.1.5 Instrumental prefix

The instrumental prefix is used to express the means by which an action was carried out. In the narrow sense, this refers to some tool or device. However, the instrumental prefix can also be used to refer to people or abstract concepts.

+--• ۲ (23)eat-PST 1SG[NOM] ice.cream[ACC] INS-spoon 'I ate the ice cream using the spoon.' **N** +- III 🟋 (24)hit-PST metal-worker[NOM] sword[ACC] INS-great-strength 'The blacksmith hit the sword with great strength.' + 60 🕒 📍 – G Pi \*-1 🗲 • • (25)go-PST 1SG[NOM] to-cinema INS-1SG[POSS]-grandmother when be[PRS] 1SG little-child 'I went to the cinema with my grandmother when I was a little kid.'

#### 4.1.6 Benefactive prefix

The benefactive prefix indicates the benefit or beneficiary of an action:

<u>š</u> 🗲 • **9 | M** (26)sell-PST 1SG[NOM] book-PL[ACC] BEN-1SG[POSS]-sister 'I sold the books for my sister.' The second secon • <u><u></u></u> (27)💽 - 🔳 collect[PRS] 1PL[NOM] wood[ACC] BEN-SUB ABIL-start 1PL[NOM] fire[ACC] <u>0</u>-BEN-SUB 'We're collecting wood so that we can start a fire.'

#### 4.1.7 Equative prefix

The equative prefix shows how the action compares to another noun phrase:

- (29) (29) ★

#### 4.1.8 Compound nouns

Multiple noun emoji can be used to form noun compounds, for example  $\Leftrightarrow$  (car) and  $\checkmark$  (key) can be combined to form  $\Leftrightarrow \checkmark$  (car key).

In compounds, the left emoji narrows down the meaning of the right emoji. Technically speaking, compounds are "left grouping".

Longer compounds can be formed as well, for example  $2\mathbb{E}$  (chocolate factory door), which means "the door of a factory that produces chocolate"<sup>6</sup>.

 $<sup>^{6}</sup>$ Not "a door that is made from chocolate and leads to a factory", which would be "right grouping".

In theory, there is no limit to the length of compounds. In practice, compounds should probably be limited to three emoji. For more complex expressions, relative clauses are preferable (see Relative clauses).

#### 4.2 Pronouns

Pronouns are very similar to possessive and demonstrative suffixes.

#### 4.2.1 Personal pronouns

Person	Singular	Plural
first	└ "I"	<b>6 *</b> "we"
second	👇 "you"	👇 👇 "you"
third	👉 "he/she/it"	friction "they"

The personal pronouns are loosely based on American Sign Language (ASL) gestures. Emoji don't quite match the actual perspective, but are intended as an approximation: Imagine a bird's eye view where the speaker is in the top center and the listener in the bottom center.

If needed, there are also gender-specific variants of the third person personal pronouns:

Person	Gender	Singular	Plural
third	male	👨👉 "he"	<b>off</b> "they" [male]
third	female	<b>©</b>	of they" [female]

#### 4.2.2 Demonstrative pronouns

Distance	Singular	Plural
proximal	ho "this"	
distal	👈 "that"	⁺those"

Example:

(30) Image: a state of the state of

#### 4.2.3 Reflexive pronouns

Reflexive pronouns refer back to another noun phrase within the same clause.

Person	Singular	Plural
first	"myself"	Jourselves"
second	✓  "yourself"	✓ ✓ ♦ ♥ Yourselves ♥
third	✓ "himself/herself/itself"	Jeff "themselves"

For the reflexive pronouns, gender-specific variants are also available:

Person	Gender	Singular	Plural
third	male	👨 ᢞ "himself"	"     "     themselves" [male]
third	female	👩 炉 "herself"	፟፼ <b>৺←</b> ← "themselves" [female]

Example:

(31) (3

The reflexive pronouns must not be confused with their English use for emphasis. To stress that an action was carried out alone, the 2 emoji is used:

(32) Control Control

#### 4.3 Verbs

Verbs are conjugated for tense and mood.

#### 4.3.1 Tense

Emoji Language distinguishes three tenses: present, past and future. While the present tense is unmarked, the past and future are indicated by appending the tense suffixes  $\leftarrow$  and  $\rightarrow$  respectively:

Tense	Example	Translation
present	λ 🖕	I go.
past	🗼 📥 🗼	I went.
future	1 🔁 🖕	I will go.

When a specific time is given, the verb is conjugated in the same manner, for example:

#### 4.3.2 Mood

The modality of a statement changes depending on the mood prefix of the verb:

Mood	Prefix	Description
indicative	(none)	What actually was/is/will be
imperative		Commands
hortative		Encouragement
jussive		Strong wishes
interrogative	?	Questions
subjunctive		What could be
permissive	<u>o</u> -	What someone is <b>allowed</b> to do
obligative	ž8	What someone <b>must</b> do
abilitive	6	What someone is <b>able</b> to do
desiderative	ę	What someone <b>wants</b> (desires) to do
negation	X	What hasn't happened/won't happen

The following example sentences illustrate the use of subjunctive, permissive, obligative, abilitive, and desiderative mood:

Subjunctive:

(34) SBJV-go.by.bike 1SG[NOM] to-store
'I would go to the store by bike.'

Permissive:

Desiderative:

Negation will be explained in the next section. See also Yes-no questions and Imperative, hortative, jussive for examples with those prefixes.

#### 4.3.3 Negation

An indicative sentence can be negated by prepending  $\times$  to the verb:

#### 4.4 Adjectives/Adverbs

Adjectives are directly prepended to nouns, for example:

In noun compounds, the adjective modifies only the first part of the noun, for example (blue shoe factory) is a factory where blue shoes are produced. The color of the factory building itself is not specified in this expression. A good way to state such details are subordinate clauses (see Subordinate clauses).

Adjectives can also be prepended to verbs, serving as adverbs, for example:

- (41) and the second second
- (42) ♥↓↓↓
  happily-play-PST F-3SG[NOM] drum-PL[ACC]
  'She happily played the drums.'

#### 4.5 Numerals

The so-called "keycap"<sup>7</sup> emoji <sup>1</sup> to <sup>9</sup> can be used as **absolute quantifiers** before nouns. If a specific number is given, plural nouns are reduplicated as usual, as the following table illustrates:

Example	Translation
0 🌷	no flower
1	one flower
2 🎙	two flowers
3 🗣 🌳	three flowers
10 🎙 🎙	ten flowers
12 🎙 🎙	twelve flowers
427 🌷 🌷	four hundred twenty-seven flowers

As a special case,  $\boxed{10}$  can be used as a shorthand for  $\boxed{10}$ , but that is not mandatory.

The ordinal suffix  $\stackrel{\scriptstyle{\checkmark}}{=}$  marks ordinal numbers:

In addition to absolute numerals, the following quantification prefixes can be applied to nouns:

Emoji	Translation	
	more	
	fewer, less	
	many, most	
¥	few, some	
$\infty$	all	

Example sentences:

(44) **§8 b C b** OBLI-drink 1SG[NOM] more-water[ACC] 'I must drink more water.'

<sup>&</sup>lt;sup>7</sup>See https://en.wikipedia.org/wiki/Keycap regarding the etymology of "keycap".

The quantifiers can also appear as verb prefixes to indicate how often repeated actions happen:

(49) 
ten-read.PST 1SG[NOM] story[ACC]
'I read the story ten times.'

Note that quantifiers always go before the expression that they modify.

#### 4.6 Comparison

Comparative expressions are formed using the suffixes  $\square$  ("more") and  $\square$  ("less").

Superlative expressions are formed using the suffixes  $\blacksquare$  ("most") and  $\blacksquare$  ("least").

The suffixes can be used in several places, such as with adjectives, adverbs and verbs.

Note, however, that comparative and superlative suffixes always go *after* the expression that they modify, which is what distinguishes them from quantifiers.

#### 4.6.1 Comparing adjectives

Example	Translation	
<b>***</b>	small shoes	
∜⊿⊷∞	$\operatorname{small}\mathbf{er}$ shoes	
	$\text{small}\mathbf{est} \text{ shoes}$	

Example sentences:

- (50) Image: (50) (50)
  read-PST 1SG[NOM] small-most-book[ACC]
  'I read the smallest book.'
- (51) \* 🖥 🔽 👤

be[PRS] 1SG[NOM] lazy-least-person[NOM] 'I'm the least lazy person.'

#### 4.6.2 Comparing adverbs

Example	Translation	
÷0 🏃	run fast	
💨 🔼 🏃	run fast ${\bf er}$	
🕂 🔁 🏵	run fast $\mathbf{est}$	

Example sentence:

(52) (52) ★ ↓ II ↓ ↓
fast-RUN[PRS] 1SG[NOM] but fast-more-run[PRS] 2SG[NOM]
'I run fast, but you run faster.'

'You run faster than me.'

#### 4.6.3 Comparing verb phrases

Example sentences:

- (53) Image: Second state of the secon
- (54) sing-most 1sg[NOM] 'I sing mostly.'

# 5 Syntax

#### 5.1 Basic statements

The basic word order is VSO (verb–subject–object). This syntax makes it particularly easy to spot which part of the sentence is actually the verb, since many emoji can be used as both nouns *and* verbs.

Because nominative and accusative case are not marked on the nouns, word order is very important for deciphering the relationship between noun phrases.

Compare the following two examples:

Hence, the subject of a sentence can never be omitted. If the subject is meant to be unspecified, the person symbol  $\checkmark$  is used:

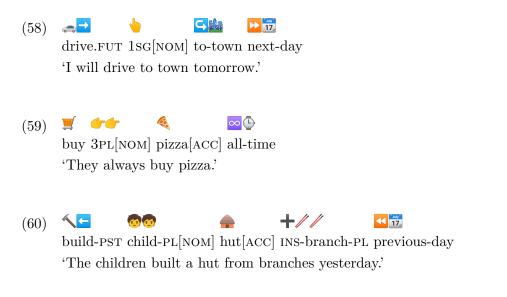

(57) C Market Someone ate the cake yesteday.'

'The cake was eaten yesterday.'

Such constructions can be used to translate passive voice constructions from other languages.

#### 5.2 Place, manner and time

After subject and direct object, additional information may be given about location/motion, manner and time:

#### 5.3 Verbal adjunct fronting

In some cases, the default word order of Emoji Language leads to ambiguity. Consider the following – admittedly contrived – example:

(61) Control Control

The statement can be interpreted in two ways:

First: "I drank {the water for the plants}", in the sense that someone drank the water that was originally meant for the plants. Perhaps due to some kind of dementia, perhaps because no other water was available in an emergency situation.

Second: "I {drank the water} for the plants", in the sense that someone drank water believing it would somehow help the plants. Perhaps because they thought that regularly drinking water themselves would remind them to water the plants.

This kind of ambiguity can be resolved by moving such additional information about place, manner and time towards the front of the sentence, directly behind the verb:

(62) C Solution
(62) C Solut

This version of the statement makes it clear that the adjunct "for the plants" indeed belongs to the verb, i.e. the speaker drank the water because they believed it would somehow help the plants (second interpretation above).

In contrast, if a speaker wanted to emphasize that they actually drank the water that was meant for the plants (first interpretation above), they could in this case use noun compounding for clarification:

Note that subject and direct object cannot be moved as freely. Their order must always stay the same, so that their role in the sentence remains recognizable.

#### 5.4 Yes-no questions

To form a yes-no question, the interrogative suffix ? is appended to the conjugated verb. The word order remains unchanged:

(64) ? ! - -

INT-go 2SG[NOM] to-town 'Are you going to town?'

- (65) ? III→
  INT-read-FUT 2SG[NOM] book[ACC]
  'Will you read the book?'
- (66) ? ? Part of the second second

#### 5.5 Wh-questions

The interrogative symbol ? also functions as a stand-alone interrogative pronoun, when it is put in the position of subject or object:

- (67) <sup>™</sup>→ ? 
  cook-FUT what[NOM] potatoe-PL
  'Who will cook the potatoes?'
- (68) read 2SG[NOM] what[ACC] 'What do you read?'

Or it can be used to ask for clarification about a given noun:

The interrogative prefix ?+ (how, literally "what-with") is used to ask for **manner**:

The interrogative prefix can be combined with the emoji for "cause" ( $\bigcirc$ ) and the benefactive prefix emoji ( $\bigcirc$ ) to ask for the **cause** or **purpose** of something, respectively. Both questions are expressed in English with the interrogative pronoun "why?".

- (78) steal-PST 2SG[NOM] cookie-PL[ACC] from-old-lady what-cause 'What made you steal the old lady's cookies?'
- (79) If a state of the state of the

The interrogative prefix ?  $\stackrel{\frown}{=}$  (literally "what-like") is used to ask for **similarity**:

(80) <sup>●</sup> <sup>●</sup> <sup>●</sup> <sup>●</sup> <sup>●</sup> <sup>2</sup> <sup>↓</sup> show-PST M-3SG[NOM] M-REFL-3SG[ACC] what-like 'What did he look like?'

The interrogative prefix ? is used to ask for the **quantity** of a noun:

(81) \* ? E
be[PRS] INT-number-bucket
'How many buckets are there?'

(82)
(82)
draw-PST 2SG[NOM] INT-number-picture
'How many pictures did you draw?'

When asking for quantity, the noun appears in singular form.

The same interrogative prefix can be used with verbs to ask for how many times something happens:

(83) ? How often did you see him?'

#### 5.6 Imperative, hortative, jussive

To form an imperative expression (command), the verb is put in imperative mood (see also Mood). The subject of the sentence specifices to whom the command is directed:

(84) A Markov Markov

(Note that the second person pronoun  $\neg$  cannot be omitted.)

When the subject is in the first person plural, the mood becomes hortative, and the sentence is meant to encourage an action:

The use of this verb prefix can be extended to form jussive mood constructions that express strong wishes in a more general way:

- (87) 1 m of the second second
- (88) \* 
  JUSS-be light[NOM]
  'Let there be light!'

#### 5.7 Subordinate clauses

Word order in subordinate clauses is also VSO (verb-subject-object).

#### 5.7.1 Relative clauses

Relative clauses are one method of embedding subordinate clauses into main clauses.

Relative clauses are *enclosed* by the relative pronoun  $\boldsymbol{\overline{o}}$ , which means a second  $\boldsymbol{\overline{o}}$  is required to mark the end of the subordinate clause, like a comma at the end of subordinate clause.

Simply put, relative clauses allow to make two statements about the same entity, without repeating it in another sentence, for example:

(89) \* OE TO < OK OF OK</p>
be[PRS] blue-factory REL make[PRS] blue-shoe-PL[ACC] REL at-1SG[POSS]-city
'There is a blue factory, that makes blue shoes, in my city.'

The argument immediately before the relative pronoun, in this case  $\bigcirc$  is implicitly inserted into the subordinate clause at the **subject** position.

The relative clause construction is essentially a shorter way of saying the following two separate sentences:

- (91) 
  (91) 
  (91) 
  (91) 
  (91) 
  (91) 
  (91)

  (91) 
  (91) 
  <

It is also possible to use the relative pronoun  $\overline{\mathbf{oo}}$  instead, which implies the **object** position, for example:

That is a simpler way of saying:

(93) \* \*
beautiful-be[PRS] dress[NOM]
'The dress is beautiful.'
(94) \* 
(94) \* 
wear[PRS] 2SG[NOM] PROX-dress

wear[PRS] 2SG[NOM] PROX-dress[ACC] 'You're wearing this dress.'

Finally, the **locatives** prefixes, as well as the **instrumental**, **benefactive** and **equative** prefixes, can be combined with the relative pronoun **o** to form the following relative pronouns:

(95) \* →→
be[PRS] banana-PL[NOM] at-store REL go[PRS] 1SG[NOM] REL
'There are bananas at the store to which I'm going.'

This is a simpler way of saying the following two sentences:

(97) ↓ ⊆ 
go[PRS] 1SG[NOM] to-PROX-store
'I'm going to this store.'

This type of construction is possible with all other locative prefixes as well, see the Locative prefixes section for a complete list.

The following examples illustrate the instrumental, benefactive, and equative relative pronouns:

**₩** 1 🔁 🖬 🗲 👩 (99)0 T • ወ ወ leave-PST woman[NOM] BEN-REL come-PST 1PL[NOM] BEN-REL 'The woman, for whom we came, left.' 0 × <u>dà T</u> 63  $\mathcal{P} \leftarrow$ 🗲 🙍 (100)wear[PRS] woman[NOM] beautiful-dress[ACC] like-REL sew-PST elf[NOM] 6 A D 3sg[acc] like-rel 'The woman wears a beautiful dress, like an elf sewed it.'

In general, relative clauses of the same type cannot be nested by themselves, but content clauses or other types of relative clauses may appear within a relative clause, for example:

#### 5.7.2 Content clauses

Another way of embedding subordinate clauses are content clauses. In this case, the whole subordinate clause – enclosed by the conjunction  $\blacksquare$  – takes the place of what would otherwise be a simple noun or pronoun:

This is a clearer way of saying:

(103) SBJV-like 2sg[NOM] PROX-present[ACC]
'You might like this present.'

(104) Control (104) (104

Content clauses are often used in the context of cognition, perception etc.

Another example that demonstrates this:

#### 5.8 Conjunctions

The conjunction + can be used in a **cumulative** sense, to join multiple verb, subjects, objects or subordinate clauses:

In the same way, the conjunction  $\bigcirc$  works in an **alternative** sense:

(114) ? ? ? ? ? ? \* 
INT-SBJV-like 2sg[NOM] coffee[ACC] or tea[ACC]
'Would you like coffee or tea?'

 🧲 (115)hear-PST or read-PST 1SG[NOM] DIST[ACC] 'I heard or read that [somewhere].' The conjunction **!** is used in to join sentences in an **adversative** way: • **II X**\* (116)63 hunger[PRS] 1SG[NOM] but NEG-be[PRS] food[NOM] 'I am hungry but there is no food.' It is also comonly used in the context of comparison (see Comparison). The conjunctions  $\triangleright$  (then) and  $\triangleleft$  (because) form illative constructions: (117)eat[PRS] 1SG[NOM] ice.cream[ACC] then be.happy[PRS] 1SG[NOM] 'If I eat ice cream, then I'm happy.' • 業 ₩ (118)T wear [PRS] 1SG [NOM] sunglasses [ACC] because shine [PRS] sun [NOM] 'I wear sunglasses because the sun is shining.' If the statements are of hypothetical nature, the verb appears in subjunctive mood: (119)SBJV-have 1sg[NOM] money[ACC] then SBJV-buy 1sg[NOM] library[ACC] 'If I had money, I would buy a library.' P Ь (120)SBJV-see-pst 1sg[Nom] 2sg[ACC] then SBJV-stop-pst 1sg[Nom]

'If I had seen you, I would have stopped.'

# 6 Pragmatics

#### 6.1 Greetings

The emoji  $\stackrel{\text{\tiny (b)}}{=}$  is used as a universal **greeting**, on meeting and parting.

To ask someone how they feel, one may use:

```
(121) ♥ ♥ ?
feel 2sG[NOM] what[ACC]
'How do you feel? [lit. "What do you feel?"]'
```

(Note that this can be understood as a prompt for a literal response, and is not necessarily part of an idiomatic greeting.)

#### 6.2 Affirmation/Denial

The emoji  $\stackrel{\bullet}{\leftarrow}$  (good, yes),  $\stackrel{\bullet}{\leftarrow}$  (okay) and sometimes  $\stackrel{\diamond}{\diamond}$  (enough) are used to signal affirmation.

Likewise,  $\mathbf{P}$  (bad, no) is used to deny a statement or request.

#### 6.3 Courtesy

To show courtesy when asking for a favor or to thank someone for something, the  $\clubsuit$  emoji is used.

When asking for something politely, this can be combined with the subjunctive mood:

(122) A ? ? A P H please! INT-SBJV-open 2sG[NOM] window[ACC] 'Would you open the window, please?'

#### 6.4 Direct speech

The standard word order for direct speech is as follows:

- ⊌ ₩ 01 ∛ ⊆⊘ **0** (123)say-PST M-3SG[NOM] " be[PRS] PROX beautiful-present " to-F-3SG 'He said to her: "This is a beautiful present."' The speech in quotation marks can also be a noun, as in the following example: **o** – (124)tell-PST M-3SG[NOM] story[ACC] to-F-3SG 'He told the story to her.' 'He told her the story.' Or a content clause: **o** (125)say-pst M-3sg[nom] sub[acc] arrive-pst F-3sg[poss]-package[nom] sub[acc] 506 to-F-3sg 'He told her that her package has arrived.' In practice, however, the syntactic position of **quoted** statements is rather free. Usually, they appear at the very end of main clauses:
- (126)
  (126)
  (126)
  (126)
  (126)
  (126)
  (126)
  (126)

#### 6.5 Date and time

A simple way to indicate time of day is using the clock emoji:

- 00 •  $( \mathbf{I} )$ (128)eat-PST 1SG[NOM] 1SG[POSS]-breakfast[ACC] at.six.o'clock 'I ate my breakfast at six o'clock.' .1. **₩**→ 60 60 (129)sleep-FUT child-PL[NOM] at.eight.o'clock 'The children will sleep at eight o'clock.' Age is expressed through possession: **21 \*\*** <u>I</u>ÎI • (130)have [PRS] 1SG [NOM] twenty-one-year-PL [ACC]

'I have twenty-one years.'

'I'm twenty-one years old.'

'How old are you?'

#### 6.6 Remote past and future

In literary works, the past and future tense markers may appear twice to indicate more distant events:

(132) **\*--**be-REMOTE-PST 1SG[NOM] student 'A long time ago, I've been a student.' (133) ₩→→

explode-REMOTE-FUT 1PL[POSS]-sun 'In the very far future, our sun is going to explode.'

# 7 Lexicon

The official Emoji Language dictionary can be found on the website: https://tmh. conlang.org/emoji-language/

#### 7.1 Derivational morphology

There are a few common patterns to derive new vocabulary from existing emoji definitions.

Country flags are choronyms that refer to **states and regions**, for example  $\blacksquare$  (France) or  $\checkmark$  (Scotland). These flags can be used to derive names of **languages** spoken in these regions (linguonyms) and **people** living in these regions (demonyms), for example  $\blacksquare$  (Spanish language) and  $\blacksquare$  (Swedish people).

The suffix  $\mathfrak{Q}$  typically denotes a person working in a specific field if there is no single emoji to refer to the concept, for example  $\mathfrak{Q}$  (teacher) exists, but the **profession**  $\mathfrak{R}\mathfrak{Q}$  (banker, literally bank-worker) must be expressed by compounding.

In general, the **abstraction** suffix  $\diamondsuit$  can be used to refer to the abstract category of something. For example, while  $\checkmark$  refers to a specific fruit (apple),  $\checkmark$  refers to any type of fruit. This sometimes necessary, when the meaning of a specific emoji would otherwise be too narrow.

#### 7.2 Flag spelling

Proper names that do not appear in the emoji lexicon, can be spelled using flag emoji. In this case, the flag emoji are used to represent letters of the Latin alphabet, which are not available as emoji.

In proper names, flags stand for the first letter of their country's name, according to the following table:

Flag	Letter	Country name
	А	America
	В	$\mathbf{B}$ razil
*	$\mathbf{C}$	Canada
	D	$\mathbf{D}$ enmark
+-	Ε	$\mathbf{E}$ ngland
	$\mathbf{F}$	France
*	G	Ghana
*	Η	Hong Kong
-	Ι	Iceland
$\succ$	J	$\mathbf{J}$ amaica
	Κ	Kenya
	L	Laos
۲	Μ	$\mathbf{M}$ exico
	Ν	$\mathbf{N}$ epal
*	0	Oman
C	Р	$\mathbf{P}$ akistan
	$\mathbf{Q}$	$\mathbf{Q}$ atar
	R	$\mathbf{R}$ ussia
+	$\mathbf{S}$	$\mathbf{S}$ witzerland
<b>C</b> *	Т	$\mathbf{T}$ urkey
*	U	Uruguay
*	V	Vietnam
•	W	${f W}$ allis & Futuna
<u>i</u>	Х	(no country available)
	Υ	Yemen
	Ζ	New $\mathbf{Z}$ ealand

When a name is spelled using flags, it is usually assumed that it is a person's name, unless something else can be assumed from context.

To remove this ambiguity, a flag name is typically suffixed with a "class noun" emoji that represents a person, country, animal etc., for example:

Flag spelling	Translation	Class
	"Kathy"	woman
	"Helsinki"	city
C· == • = + 🛅	"Times"	newspaper

Note that the Emoji Language has undergone a "spelling reform" in June 2021. In the original version, "G", "I", and "J" were represented using the country flags of Greece

( $\stackrel{\bullet}{=}$ ), India ( $\stackrel{\bullet}{=}$ ), and Japan ( $\stackrel{\bullet}{\bullet}$ ), respectively, so you might still encounter them in early Emoji Language texts.

The spelling has been changed because the names of these countries start with different letters in their native language (Elláda, Bhārat, and Nippon, respectively) compared to their English names.

The goal is to use country names with matching endonym and exonym<sup>8</sup> instead, to make the corresponding letters more easily recognizable and avoid any ambiguity. For the letter "O", currently no country matching this criterion is available, so the flag of Oman ( $\blacksquare$ , 'Umān) has been kept.

#### 8 Appendix

#### 8.1 Morphosyntax overview

Sentence: Verb (Subject (Object)) (Place/Motion ...) (Time)

Noun: (Interrog..)(Loc.|Ins.|Ben.|Equ.)(Dem.)(Poss.)(Quant.)(Adj.)Noun Stem(Pl.)

Verb: (Imp.|Interrog.)(Mood)(Neg.)(Quant.)(Adverb)Verb Stem(Tense)

Adjective/Adverb: Stem(Comparison)
